

CELL-DYN 29 Plus Control (with Retic)

CONTROL L N H

CONTROL L N H

CONTROL L N H

CONTROL L N H

INTENDED USE

CELL-DYN 29 Plus Control (with Retic) is a Whole Blood hematology quality control material used to monitor results obtained on CELL-DYN hematology systems.

SUMMARY PRINCIPLE

It is an established laboratory procedure to use stable quality control material to monitor the performance of diagnostic tests. CELL-DYN 29 Plus Control (with Retic) is composed of stable materials that provide a means to verify the accuracy and precision of results for hemogram, WBC differential, and reticulocyte parameters; it is handled and run in the same manner as patient specimens and is available in three levels representing low hemogram/high reticulocyte, normal hemogram/intermediate reticulocyte, and high hemogram/low reticulocyte results.

REAGENT

CELL-DYN 29 Plus Control (with Retic) is an *in vitro* diagnostic product that may contain any or all of the following: stabilized human or mammalian red blood cells, human, mammalian or simulated white blood cells, and a platelet component in a preservative medium.

WARNINGS AND PRECAUTIONS

IVD

For *In Vitro* Diagnostic Use

CAUTION: This product contains human sourced and/or potentially infectious components. Refer to the REAGENT section of this package insert. No known test method can offer complete assurance that products derived from human sources or inactivated microorganisms will not transmit infection. Therefore, all human sourced materials should be considered potentially infectious. It is recommended that these reagents and human specimens be handled in accordance with the OSHA Standard on Bloodborne Pathogens¹. Biosafety Level 2² or other appropriate biosafety practices^{3,4} should be used for materials that contain or are suspected of containing infectious agents.

- All human source material used to manufacture this product was non-reactive for antigens to Hepatitis B (HBsAg), negative by tests for antibodies to HIV (HIV-1/HIV-2) and Hepatitis C (HCV), non-reactive for HIV-1 RNA and HCV RNA by licensed NAT, and non-reactive to Serological Test for Syphilis (STS) using techniques specified by the U.S. Food and Drug Administration.

Safety Data Sheets are available at www.abbottdiagnostics.com or contact your local representative.

For additional information, refer to the CELL-DYN Operator's Manual.

INSTRUCTIONS FOR USE

Refer to CELL-DYN 29 Plus Control (with Retic) Assay Sheet for mixing instructions.

PROCEDURE

Refer to the quality control procedures provided in the appropriate CELL-DYN Operator's Manual.

STORAGE AND STABILITY

10°C Protect vials from overheating and freezing. CELL-DYN 29 Plus Control (with Retic) is stable through the expiration date when stored at 2° to 10°C (36-50°F). After opening, CELL-DYN 29 Plus Control (with Retic) is stable throughout the open-vial dating, as indicated on the Assay Sheet, when stored at 2° to 10°C. Once opened, vials can be used only for the number of days stated on the assay sheet, provided that they are handled properly: avoid unnecessary cycles of warming and cooling, prolonged exposure to ambient temperature, or vigorous mixing, all of which may damage the control. In addition, the volume in the vial must meet or exceed the minimum sample volume stated in the Operator's Manual.

Trending in the MCV or RDW parameter over the product shelf life is inherent to hematology control products. This characteristic does not indicate product instability. Ranges and limits for these parameters may need to be adjusted.

INDICATIONS OF DETERIORATION

CELL-DYN 29 Plus Control (with Retic), after mixing, should be similar in appearance to fresh whole blood. In unmixed, refrigerated containers, the supernatant fluid may appear cloudy and reddish. Other discoloration of the supernatant fluid, or marked hemolysis, may indicate deterioration. Inability to obtain expected values may indicate product deterioration. Rough handling, freezing, overheating, and contamination are frequent causes of product damage. Incomplete mixing or instrument malfunction may also cause unacceptable results. **Do not use the product if deterioration is suspected;** contact Abbott Customer Service.

Customer Service: Contact your local representative or find country specific contact information on www.abbottdiagnostics.com

PRODUCT LIMITATIONS

Proper storage and use of this product as described in this document is required for optimal performance. The components of this product are not suitable for microscopic differential analysis or spun microhematocrit. Values are not transferable to systems not listed on the assay sheet. The product is intended for use as supplied. Adulteration by dilution or addition of any materials to the product as supplied invalidates any diagnostic use of the product.

CELL-DYN Enzymatic Cleaner Concentrate solution must be thoroughly removed from the analyzer Wash Block and/or Probe before running control products.

Control products are not to be used as calibrators. The white blood cell components simulate white blood cells in size, not morphology.

EXPECTED VALUES AND THEIR DERIVATION

Refer to the table of values on the enclosed assay sheet for expected results. The assay values are obtained from replicate testing on CELL-DYN Systems. The mean range is an estimate of observed interlaboratory variation due to reagent differences, maintenance, calibration, and operating technique. The Systems are calibrated as follows:

- using whole blood according to CLSI and ICSH-recommended manual, reference methods^{5,6,7,8,9,10}
- using a commercially available CELL-DYN calibrator
- using the appropriate, reliably calibrated CELL-DYN hematology analyzer.

PERFORMANCE CHARACTERISTICS

The assay values, with their associated mean ranges, reflect the expected biological variability of the control materials and the estimated interlaboratory variation.

Each laboratory should establish a mean and acceptable range for each lot of control material. The laboratory mean should fall within the listed Mean Range. An individual laboratory's range may include results above and below the listed Mean Range. Laboratories may consider results acceptable when at least 95% of test results are within the laboratory's expected range. For additional information, refer to the appropriate CELL-DYN Operator's Manual.

ORDERING INFORMATION

REF 08H58-01 CELL-DYN 29 Plus Control (with Retic) 12 x 3.0-mL Vials

REF 08H58-02 CELL-DYN 29 Plus Control (with Retic) 6 x 3.0-mL Vials

VERWENDUNGSZWECK

Die CELL-DYN 29 Plus Control (with Retic) ist eine hämatologische Vollblutqualitätskontrolle zur Überwachung der mit den CELL-DYN Hämatologiesystemen ermittelten Ergebnisse.

ZUSAMMENFASSUNG UND PRINZIP

Stabilisierte Qualitätskontrollen dienen in der Laborpraxis zur Überwachung der Leistungsfähigkeit von diagnostischen Tests. Die CELL-DYN 29 Plus Control (with Retic) setzt sich aus stabilisiertem Material zusammen und dient zur Überwachung der Genauigkeit und Präzision von Ergebnissen des Blutbilds, der WBC-Differenzierung und von Retikulozytenparametern. Die Kontrolle wird wie eine Patientenprobe gehandhabt und getestet und steht in drei Konzentrationen, Blutbild niedrig/Retikulozyten hoch, Blutbild normal/Retikulozyten mittel und Blutbild hoch/Retikulozyten niedrig, zur Verfügung.

REAKGENZ

Die CELL-DYN 29 Plus Control (with Retic) ist ein *In-vitro*-Diagnoskop, das folgende Bestandteile enthalten kann: stabilisierte humane oder Säugetier-Erythrozyten, humane, Säugetier- oder simulierte Leukozyten und Thrombozytenkomponenten in einem Konservierungsmittel.

VORSICHTSMASSNAHMEN

IVD

Zur Verwendung als *In-vitro*-Diagnoskop

ACHTUNG: Dieses Produkt enthält Komponenten menschlichen Ursprungs und/oder potenziell infektiöse Bestandteile. Eine detaillierte Auflistung entnehmen Sie bitte dem Abschnitt REAGENZ in dieser Packungsbeilage. Keine derzeit bekannte Testmethode kann mit absoluter Sicherheit ausschließen, dass Infektionen durch Humanmaterial oder inaktivierte Mikroorganismen übertragen werden können. Daher sollten alle Materialien menschlichen Ursprungs als potenziell infektiös betrachtet werden. Es wird empfohlen, diese Reagenzien und Humanproben gemäß dem OSHA-Standard für hämatogene Krankheitserreger¹ zu handhaben. Beim Umgang mit Materialien, die infektiöse Erreger enthalten oder bei denen Verdacht besteht, dass sie infektiöse Erreger enthalten, sollte Biosafety Level 2² sowie weitere angemessene Sicherheitspraktiken für den Umgang mit biogefährlichen Substanzen^{3,4} angewendet werden.

- Jedigleiches für die Herstellung dieses Produkts verwendete humane Quellmaterial war nicht reaktiv für Hepatitis B-Antigene (HBsAg) und negativ bei Tests auf Antikörper gegen HIV (HIV-1/HIV-2) und Hepatitis C (HCV) sowie nicht reaktiv für HIV-1 RNA und HCV RNA gemäß lizenziertem NAT-Nachweis, und nicht reaktiv auf serologische Syphilistests (STS). Dies wurde mit Hilfe von Techniken getestet, die von der US-amerikanischen Food and Drug Administration vorgeschrieben werden.

Sicherheitsdatenblätter sind unter www.abbottdiagnostics.com oder über den Kundendienst erhältlich. Weitere Informationen enthalten die CELL-DYN Bedienungsanleitung.

HINWEIS ZUR VERWENDUNG

Hinweise zum Mischen enthalten das Datenblatt der CELL-DYN 29 Plus Control (with Retic).

VERFAHREN

Eine detaillierte Beschreibung der Verfahren zur Qualitätskontrolle enthält die entsprechende CELL-DYN Bedienungsanleitung.

LAGERUNG UND HALTBARKEIT

10°C Die Röhrchen nicht überhitzen oder einfrieren. Die CELL-DYN 29 Plus Control (with Retic) ist bis zum angegebenen Verfallsdatum haltbar, sofern sie bei 2 bis 10 °C gelagert wird. Nach dem Öffnen ist die CELL-DYN 29 Plus Control (with Retic) für den auf dem Datenblatt angegebenen Zeitraum für geöffnete Röhrchen haltbar, sofern sie bei 2 bis 10 °C gelagert wird. Bei ordnungsgemäßer Behandlung können geöffnete Röhrchen noch für die im Datenblatt angegebene Anzahl an Tagen verwendet werden. Wegen einer möglichen Schädigung der Kontrolle unnötiges Abkühlen und Wiederaufwärmen, längere Aufbewahrung bei Zimmertemperatur und heftiges Schütteln vermeiden. Außerdem muss in den Röhrchen mindestens das in der Bedienungsanleitung angegebene Mindestprobenvolumen enthalten sein.

Abweichungen bei den Parametern MCV oder RDW während der zulässigen Verwendbarkeitsdauer des Produkts treten bei Hämatologiekontrollen häufig auf und sind kein Hinweis auf Instabilität. Die Mittel- und Grenzwerte müssen unter Umständen angepasst werden.

ANZEICHEN EINER QUALITÄTSMINDERUNG ODER SCHÄDIGUNG

Die CELL-DYN 29 Plus Control (with Retic) sollte nach dem Mischen frischem Vollblut ähneln. In ungemischten, gekühlten Röhrchen kann die überstehende Flüssigkeit trüb und blassrot erscheinen. Andere Verfärbungen des Überstands oder eine ausgeprägte Hämolyse können auf einen Zerfall von Erythrozyten hinweisen. Ebenso gilt eine Abweichung von den erwarteten Werten als Hinweis auf eine Schädigung des Produkts. Häufige Ursachen einer Qualitätsminderung sind unsachgemäße Handhabung, starkes Abkühlen und überhitzen sowie Kontaminierung. Abweichende Ergebnisse können ebenfalls durch unzureichendes Mischen der Kontrolle oder einen Fehler des Systems verursacht werden. **Produkt nicht verwenden, wenn eine Qualitätsverschlechterung vermutet wird;** senden den Abbott Kundendienst kontaktieren.

Bei Fragen wenden Sie sich bitte an Ihren Abbott Kundendienst. Länderspezifische Kontaktinformationen finden Sie auch unter www.abbottdiagnostics.com.

GRENZEN DES VERFAHRENS

Die oben angegebenen Bestimmungen zur Lagerung und Verwendung des Produkts müssen unbedingt beachtet werden, um eine optimale Leistungsfähigkeit zu gewährleisten. Die Komponenten dieses Produkts eignen sich nicht für die mikroskopische Differenzierung oder den Zentrifugahämatokrit. Die Werte sind nicht auf Systeme übertragbar, die nicht im Datenblatt aufgeführt sind. Das Produkt darf nur wie angegeben verwendet werden. Veränderungen durch Verdünnen oder Hinzufügen von Materialien zum Produkt annulieren den diagnostischen Nutzen dieses Produktes.

Die CELL-DYN Enzymatic Cleaner Concentrate Lösung gründlich vom Analysator-Waschblock und/oder der Nadel entfernen, bevor die Kontrollprodukte analysiert werden.

Kontrollen dürfen nicht als Kalibratoren verwendet werden. Die Leukozytenkomponenten simulieren die Größe von Leukozyten, nicht ihre Morphologie.

ERWARTETE WERTE UND IHRE ABWEICHUNGEN

Die erwarteten Werte sind der Wertetabelle des beigelegten Datenblatts zu entnehmen. Die Testwerte wurden durch Mehrfachbestimmungen mit CELL-DYN Systemen ermittelt. Bei dem zulässigen Bereich handelt es sich um eine Schätzung der von Labor zu Labor möglichen Abweichungen basierend auf Unterschieden bei den Reagenzien, der Wartung, der Kalibrierung und der Bedienung. Die Systeme wurden folgendermaßen kalibriert:

- unter Verwendung von Vollblut, das entsprechend den CLSI- und ICSH-Empfehlungen mit Hilfe manueller Referenzmethoden kalibriert wurde.^{5,6,7,8,9,10}
- unter Verwendung eines ordnungsgemäß kalibrierten CELL-DYN Hämatologiesystems.
- unter Verwendung eines ordnungsgemäß kalibrierten CELL-DYN Röhrchen.

LEISTUNGSMERKMALE

Die Zielwerte und die ihnen zugeordneten zulässigen Bereiche berücksichtigen die zu erwartende biologische Variabilität der Kontrollmaterialien und die von Labor zu Labor möglichen Abweichungen.

Jedes Labor sollte für jede Kontrollcharge einen erwarteten und einen zulässigen Bereich festlegen. Der Labormittelwert sollte innerhalb des angegebenen zulässigen Bereichs liegen. Der sich für das jeweilige Labor ergebende Bereich kann auch Werte einschließen, die oberhalb oder unterhalb des deklarierten zulässigen Bereichs liegen. Ergebnisse können als akzeptabel angesehen werden, wenn mindestens 95 % der Testergebnisse innerhalb des erwarteten Bereichs liegen. Weitere Informationen enthält die entsprechende CELL-DYN Bedienungsanleitung.

CELL-DYN 29 Plus Control (with Retic)

CONTROL | L | N | H

FINALITÀ D'USO
CELL-DYN 29 Plus Control (with Retic) è un materiale di controllo di qualità di ematologia (sangue intero) usato per monitorare i risultati ottenuti con i sistemi per ematologia CELL-DYN.

RIASSUNTO E PRINCIPIO

L'utilizzo di un materiale di controllo di qualità stabile è una procedura di laboratorio riconosciuta per il monitoraggio della prestazione dei test diagnostici. CELL-DYN 29 Plus Control (with Retic) è costituito da materiali stabili che consentono la verifica dell'accuratezza e della precisione dei risultati per i parametri dell'emocromo, della formula leucocitaria e dei reticolociti. Viene trattato e analizzato in maniera identica ai campioni dei pazienti ed è disponibile a tre concentrazioni che rappresentano i seguenti risultati: emocromo basso/reticolociti alti, emocromo normale/reticolociti medi, emocromo alto/reticolociti bassi.

REAGENTE

CELL-DYN 29 Plus Control (with Retic) è un prodotto diagnostico *in vitro* che può contenere uno o tutti i seguenti componenti: eritrociti stabilizzati umani o di mammifero, leucociti umani, di mammifero o analoghi leucocitari e una componente piastrina in una soluzione conservante.

AVVERTENZE E PRECAUZIONI

IVD

Per uso diagnostico *in vitro*.

ATTENZIONE: questo prodotto contiene componenti di origine umana e/o potenzialmente infettivi. Consultare la sezione REAGENTE del presente foglietto illustrativo. Nessuno dei metodi analitici conosciuti può garantire in modo assoluto che prodotti di origine umana o derivati da microrganismi inattivati non possano trasmettere infezioni. Pertanto tutti i materiali di origine umana devono essere considerati potenzialmente infettivi. Si raccomanda di trattare questi reagenti e i campioni di origine umana secondo quanto descritto nella pubblicazione OSHA Standard relativa agli agenti patogeni di origine ematica¹. I materiali contenenti o sospettati di contenere agenti infettivi devono essere trattati in accordo con quanto descritto nella pubblicazione Biosafety Level 2² o altre pratiche di biosicurezza appropriate^{3,4}.

- Tutto il materiale di origine umana usato per la produzione di questo prodotto è risultato non reattivo per gli antigeni dell'epatite B (HBsAg), negativo ai test per gli anticorpi per l'HIV (HIV-1/HIV-2) e per l'epatite C (HCV), non reattivo per l'HIV-1 RNA e l'HCV RNA con test NAT autorizzati e non reattivo al test sierologico per la sifilide (STS), eseguito con le metodiche specificate dalla Food and Drug Administration degli Stati Uniti.

Le schede di sicurezza sono disponibili sul sito www.abbottdiagnostics.com oppure rivolgersi al responsabile locale.

Per ulteriori informazioni fare riferimento al Manuale d'Impiego del Sistema CELL-DYN.

ISTRUZIONI PER L'USO

Per le istruzioni relative alla miscelazione fare riferimento alla scheda dati del CELL-DYN 29 Plus Control (with Retic).

PROCEDURA

Fare riferimento alle procedure per il controllo di qualità riportate nel relativo Manuale d'Impiego del Sistema CELL-DYN.

CONSERVAZIONE E STABILITÀ

10°C Proteggere le provette da surriscaldamento e congelamento. CELL-DYN 29 Plus Control (with Retic) è stabile fino alla data di scadenza se conservato a 2-10°C (36-50°F). Una volta aperto, il CELL-DYN 29 Plus Control (with Retic) si mantiene stabile fino alla data di scadenza per la provetta aperta indicata sulla scheda dati del dosaggio, se conservato a 2-10°C. Una volta aperte, le provette possono essere utilizzate solo per il numero di giorni indicato nella scheda dati del dosaggio a condizione che vengano trattate in modo corretto: evitare inutili cicli di riscaldamento e raffreddamento, esposizioni prolungate a temperatura ambiente o eccessive miscelazioni che possono danneggiare il controllo. Inoltre, il volume nella provetta deve essere pari o superiore al volume minimo del campione riportato nel manuale d'impiego.

È possibile che i valori dei parametri MCV o RDW subiscano variazioni durante il periodo di validità del prodotto, fenomeno che è proprio dei prodotti di controllo ematologici. Questa caratteristica non indica l'instabilità del prodotto. Range e limiti di tali parametri possono richiedere un aggiustamento.

INDICAZIONI SUL DETERIORAMENTO

Dopo la miscelazione, il CELL-DYN 29 Plus Control (with Retic) deve apparire simile a sangue intero fresco. Nei contenitori refrigerati e non miscelati il liquido sovraventante può apparire torbido e rossastro. Il liquido sovraventante meno colorato o con emolisi marcatà può indicare deterioramento. Il mancato ottenimento dei valori previsti può essere indice di deterioramento del prodotto. Trattamento improprio, congelamento, surriscaldamento e contaminazione sono frequenti cause di danno al prodotto. Una miscelazione incompleta o il malfunzionamento dello strumento possono provocare risultati non accettabili. Non usare il prodotto se si sospetta un possibile deterioramento; contattare il Servizio Clienti Abbott.

Assistenza clienti: contattare il rappresentante locale oppure individuare i dati di contatto specifici sul sito www.abbottdiagnostics.com.

LIMITI DEL PRODOTTO

Per ottenere prestazioni ottimali, il prodotto deve essere conservato e utilizzato come indicato sopra. I componenti di questo prodotto non sono idonei all'analisi della formula leucocitaria al microscopio o al microematocrito in centrifuga. I valori non sono applicabili a sistemi non elencati nella scheda dati del dosaggio. Il prodotto deve essere utilizzato così come viene fornito. La diluizione o l'aggiunta di altri materiali al prodotto ne invalidano qualsiasi uso diagnostico. Prima di analizzare i prodotti di controllo, la soluzione CELL-DYN Enzymatic Cleaner Concentrate deve essere completamente rimossa dal blocco di lavaggio e/o dalla sonda dell'analizzatore.

I controlli non possono essere utilizzati come calibratori. Il componente leucocitario è simile ai leucociti per dimensione, non per morfologia.

VALORI PREVISTI E LORO DERIVAZIONE

Fare riferimento alla tabella dei valori riportata nella scheda dati del dosaggio allegata per i risultati previsti. I valori del dosaggio sono stati ottenuti da test ripetuti su sistemi CELL-DYN. Il range medio è una stima della variazione osservata fra i diversi laboratori dovuta a reagenti, manutenzione, calibrazione e tecniche operative differenti. I sistemi vengono calibrati come segue:

- usando sangue intero come previsto dalle indicazioni CLSI e ICSH per i metodi manuali di riferimento^{5,6,7,8,9,10}
- usando un calibratore CELL-DYN disponibile in commercio
- usando un analizzatore ematologico CELL-DYN appropriato correttamente calibrato

CARATTERISTICHE DI PRESTAZIONE

I valori del dosaggio, insieme ai loro range medi associati, riflettono la variabilità biologica prevista dei materiali di controllo e la variazione stimata fra i laboratori.

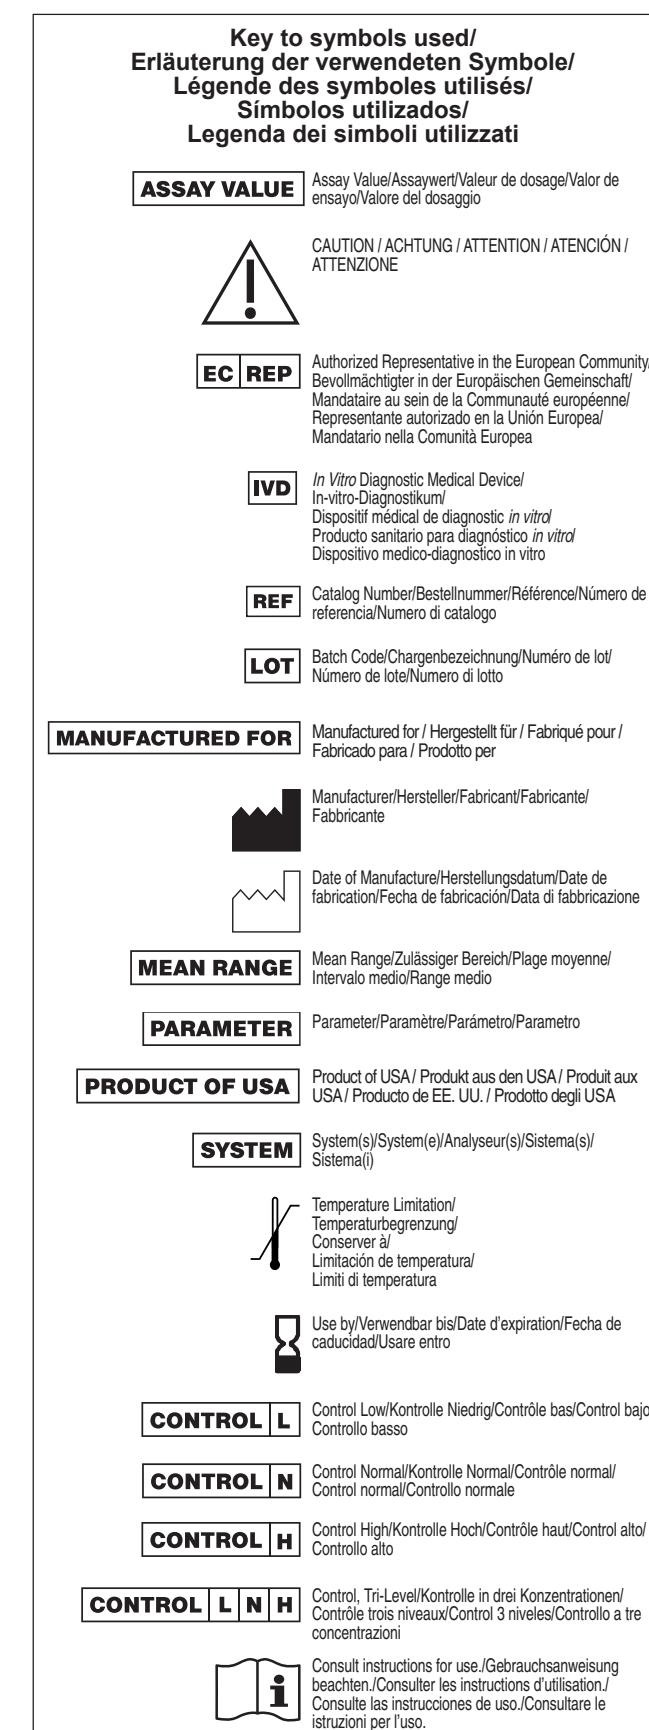

Ciascun laboratorio deve stabilire i propri range medi e accettabili per ogni lotto di materiale di controllo. La media di laboratorio deve rientrare nel range medio elencato. Il range di un singolo laboratorio può includere risultati inferiori o superiori al range medio elencato. I laboratori possono considerare i risultati accettabili quando almeno il 95% dei risultati dei test rientra nel range previsto dal laboratorio. Per ulteriori informazioni fare riferimento al relativo Manuale d'Impiego del Sistema CELL-DYN.
